

# BLACK ARROW

## Innovation and performance

A new technical concept revolutionises the installation of frame screens: the fabric is fixed to the frame without any buttons, eyelets or rubber bands.

The anchoring is made by means of an innovative arrow-shaped PVC profile welded around the projection fabric (it also works as a border) which is positioned behind a dedicated groove in the aluminium frame (A). In order to meet the various installation needs, the frame also features an outer groove (in case the room temperature is high) (B) and an inner one (when the screen is installed in cold places) (C).

Thanks to its simplicity, installation is much faster than the traditional button and eyelet border systems and it gets stable and long lasting.

This innovative assembling system allows complete installation made by a single individual who will be able to mount the screen step by step directly to the wall.

The black PVC profile will appear flat and even with the fabric and will also act as a light absorbing material since it is striped by several micro-grooves.

The linear anchoring system grants the uniform tensioning of the fabric avoiding perimeter imperfections present in all front eyelet anchoring systems.

Applications of this screen can fit any kind of environment and situation due to its mounting simplicity and the wide range of sizes, from the standard to the very large ones.

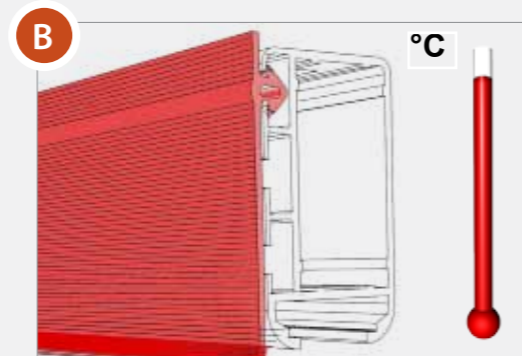

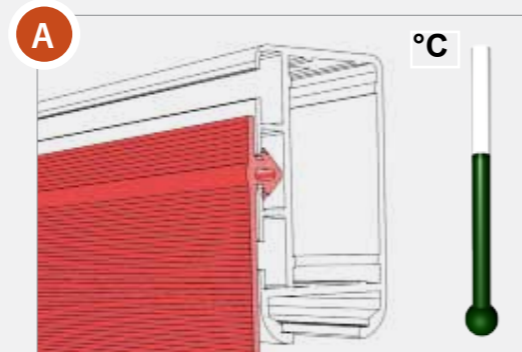

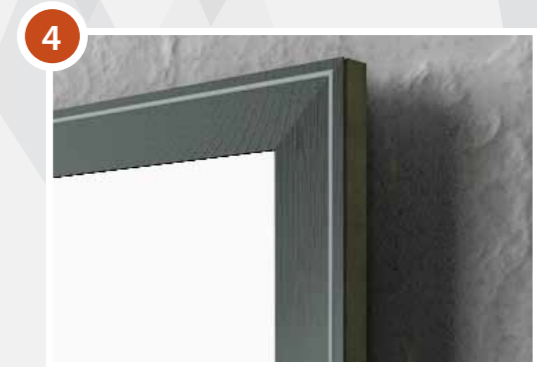

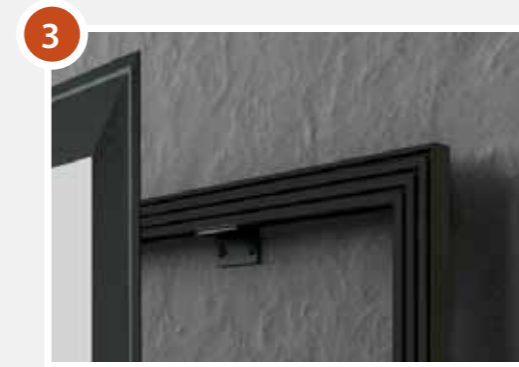

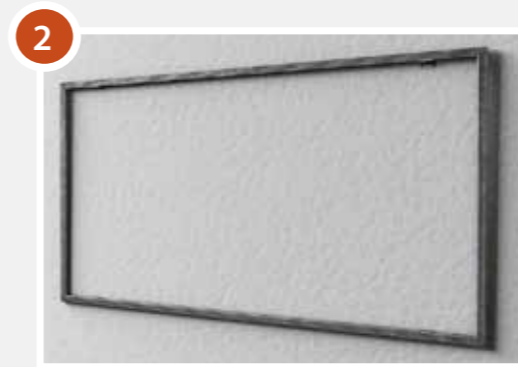

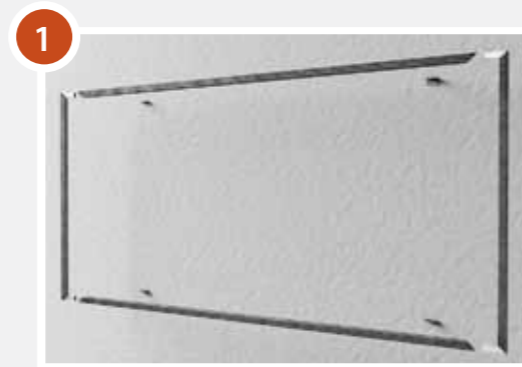

## Technical details

### Screen characteristics

- quick and easy installation
- light aluminium structure behind the fabric
- projection fabric fixing system by means of an "arrow-shaped" black PVC profile
- light absorbing, black PVC profile flat and even with the fabric

### Available fabrics

- Diamond
- Microperforated
- Grey High Contrast
- Ambra retro-projection

## Available sizes chart
